Description

Intended User

Features

User Interface Mocks
- Screen 1
- Screen 2
- Screen 3
- Screen 4
- Screen 5
- Screen 6

Key Considerations
- How will your app handle data persistence?
- Describe any edge or corner cases in the UX.
- Describe any libraries you'll be using and share your reasoning for including them.
- Describe how you will implement Google Play Services or other external services.

Next Steps: Required Tasks
- Task 1: Project Setup
- Task 2: Implement UI for Each Activity and Fragment
- Task 3: Build Variants
- Task 4: Create Identity Service
- Task 5: Implement Database
- Task 6: Implement Widget
- Task 7: Implement Material Design

AG daily

Description

If you are planning to reform your house or build something big or complex and need to control every part of your budget, don't worry. AG daily will help you because it provides an easy, clean and detailed way of monitoring your budget without being afraid with the amount of materials or the reform delay.

Intended User

AG daily is for all the person who will reform some building of his house, office and etc.

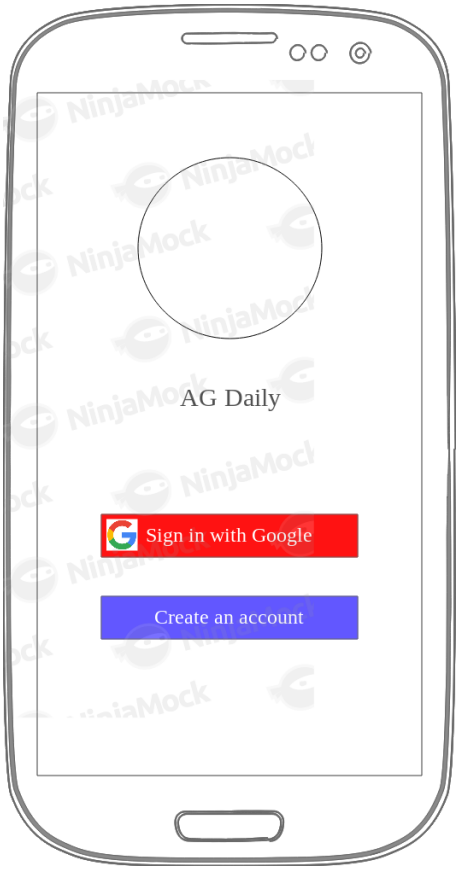
Features

All the features of AG daily are:

- To register a reform in the database;
- To check all the informations about that reform;
- To verify a daily report;
- To report about the reform every day;
- To check all the materials registered in the database;
- To add another material used in the reform;
- To analyse the finance life.

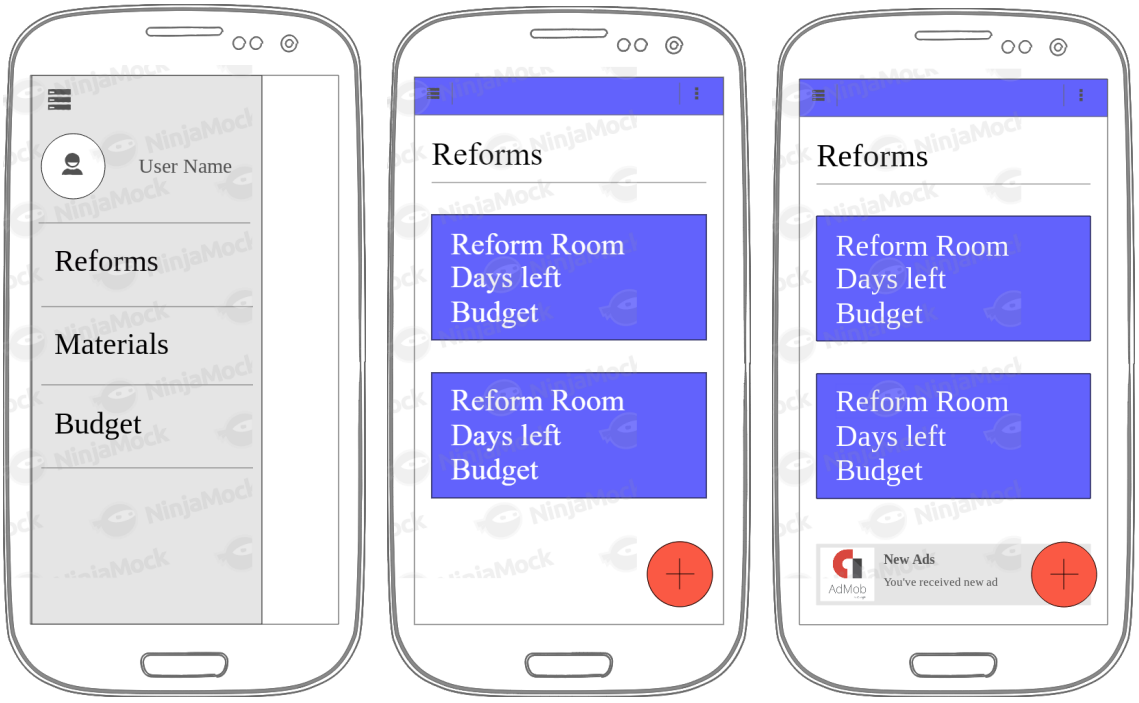
User Interface Mocks

Screen 1



The user can login in the app by setting his google account. If the user does not have a google account, it is possible to create an offline account by app.

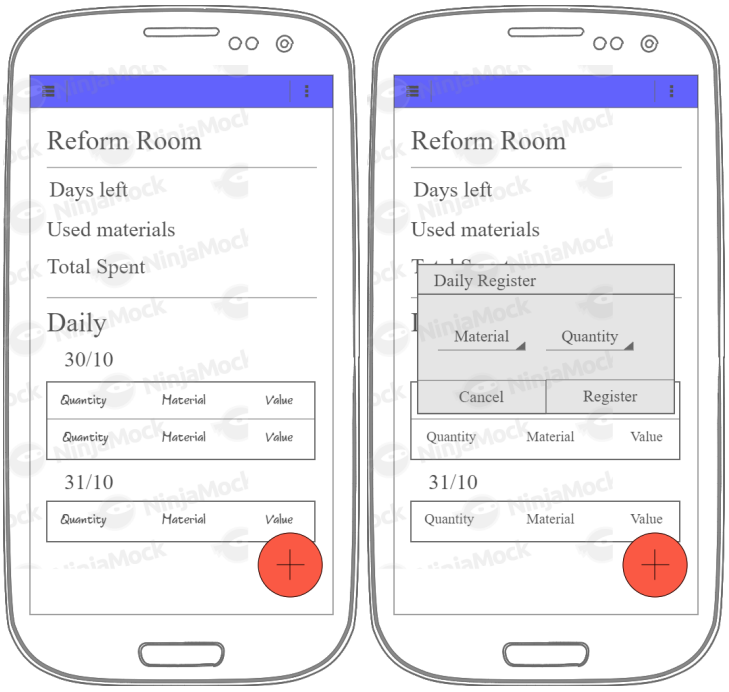
Screen 2



Paid Version Free Version

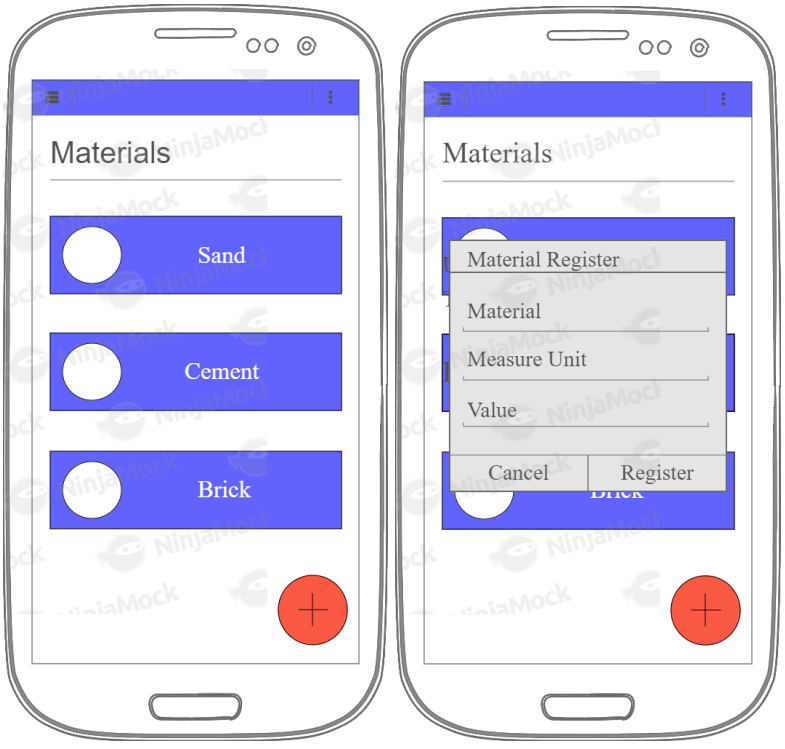
The user will face in the main screen of the app all the reforms registered in the database. The informations which will be showing are the room of the building, days left until the reform conclusion and the budget determined for that reform. It is possible to register other reforms and fill all the required fields by clicking in the floating button.

Screen 3



By clicking in some reform you will face the screen above. In this screen you can check all the information about that reform such as days left until its conclusion, the quantity of materials used until now and the total spent of that room. It is also possible to see the report of all reform days. To add a report of the day you must click in the floating button and fill all the required fields (the material used and its quantity). After that, the value will be calculated automatically.

Screen 4

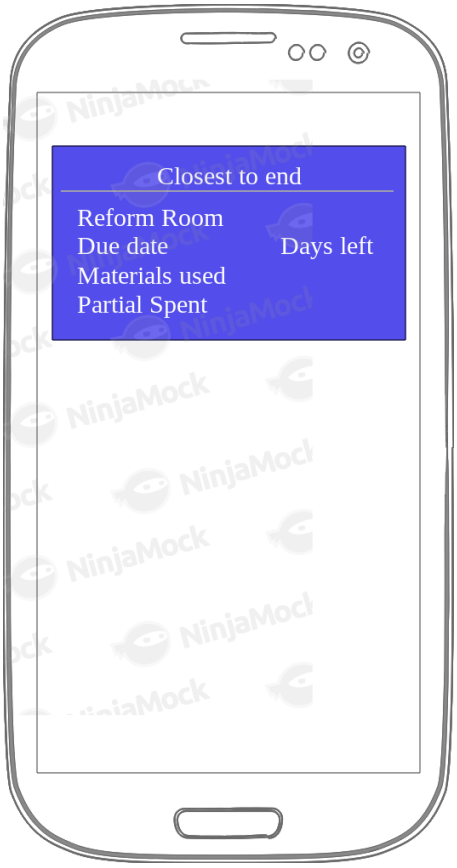


User can check all the materials registered in the app by clicking in the option “Materials” in the navigation drawer. After that the user will face a screen with all the materials used in the reform. If user needs to add another material, just click in floating button and fill all the required fields.

Screen 5

In the “Budget” option, user can check all his investments, spent of the day and remaining cash.

Screen 6



In the widget, user will be able to see the information of closest reform to due date.

Key Considerations

What will be the common project requirements in the app?

AG daily will be written in Java language and it will use stable release versions of all libraries and Gradle. App will keep all strings in a strings.xml file and will enable RTL layout switching on all layouts.

Will AG daily support accessibility?

Yes, AG daily will include content descriptions in all Buttons and Images.

How will your app handle data persistence?

AG daily will handle Room as data persistence using LiveData and ViewModel.

Describe any edge or corner cases in the UX.

When the user login with google account or create an account in the app, user will face the main activity with all registered reforms. By clicking in any reform, user will be able to see a detailed overview of current situation like partial spent, days left and daily report showing how many materials have been used. If the user clicks in materials button, all the materials registered in the database will be shown. By clicking in the budget button, user will face a detailed situation of finance life. In the main activity, picture profile and its username will be shown in the navigation drawer.

Describe any libraries you'll be using and share your reasoning for including them.

Butterknife library will be used in the app and Asynctask will be used to get all the measure units when the user registers a material in the database.

Describe how you will implement Google Play Services or other external services.

AG daily will use Identity and Admob as google play services.

Next Steps: Required Tasks

This is the section where you can take the main features of your app (declared above) and break them down into tangible technical tasks that you can complete one at a time until you have a finished app.

Task 1: Project Setup

The setup configuration follows the items below:

- Create Java library to fit all the java classes and Android Library to fit all the android activities;
- Configure and import all gradle libraries.

Task 2: Implement UI for Each Activity and Fragment

The Implementation of the app will follow the steps below:

- Build UI for LoginActivity;
- Build UI for MainActivity;
- Build Fragment for Reform screen;
- Build Fragment for Material screen;
- Build Fragment for Budget screen.

Task 3: Build Variants

Build Variants will be created as follows below:

- Create flavor dimensions for paid and free versions;
- Apply Admob service for free version.

Task 4: Create Identity Service

Identity will be used to login in the app:

- Make connection with user google account;
- Get user picture and name.

Task 5: Implement Database

Database will use Room as data persistence:

- Create SQL database;
- Implement LiveData and ViewModel.

Task 6: Implement Widget

Widget will be used to show the closest reform to end.

- Create widget and set all reform information.

Task 7: Implement Material Design

Material design will follow the steps below:

- Choose pattern colors;
- Apply primary, secondary and accent colors;
- Apply some transitions.
